

Module:- SECURITY CONCEPT (SHODAN)

Name:- Prithviraj Nikam

Lab Assignments:

SHODAN:- Shodan is a search engine that lets users search for various types of servers connected to the internet using a variety of filters.

- First of all create a account on shodan
- Then type shodan keyword in search box to find out the data and information about target

2. Execute following keywords in shodan

----->org:"Amazon" ssl:"target"

It is sho

The screenshot shows the Shodan search interface with the query "org:"Amazon" ssl:"target"" entered in the search bar. The results page displays 584 total findings. On the left, there are two sections: "TOP COUNTRIES" showing the United States (362), Ireland (64), Australia (39), United Kingdom (29), and Japan (25); and "TOP PORTS" showing port 443 (530), 5432 (30), 4443 (7), 8081 (7), and 25 (2). The main results area shows two detailed entries for IP addresses 18.213.225.182 and 52.3.99.168, both associated with Amazon Technologies Inc. and the United States. The first entry is a "cloud" host, while the second is also labeled "cloud". Both entries show SSL certificates issued by GlobalSign. The first entry's SSL certificate is for "target-ams.com" and the second for "toluainights-internal.com". Both entries result in a 403 Forbidden error due to access denial.

Vulnerabilities

Note: the device may not be impacted by all of these issues. The vulnerabilities are implied based on the software and version.

CVE-2022-0778 The BN_mod_sqrt() function, which computes a modular square root, contains a bug that can cause it to loop forever for non-prime moduli. Internally this function is used when parsing certificates that contain elliptic curve public keys in compressed form or explicit elliptic curve parameters with a base point encoded in compressed form. It is possible to trigger the infinite loop by crafting a certificate that has invalid explicit curve parameters. Since certificate parsing happens prior to verification of the certificate signature, any process that parses an externally supplied certificate may thus be subject to a denial of service attack. The infinite loop can also be reached when parsing crafted private keys as they can contain explicit elliptic curve parameters. Thus vulnerable situations include: -
